AL-2 can also be used for wound healing, i.e. accelerating neovascularisation of, e.g. burns and ulcers. The encoding nucleic acids are useful in preparing antibodies that specifically bind to the AL-2 protein. The antibodies and the AL-2 antagonists are useful in diagnosing and treating various neuronal disorders. AL-2 antagonists can be used for modulating angiogenesis. They can also be used for the treatment of tumours, acute myeloid leukaemia (AML), chronic myeloid leukaemia (CML), myelodysplastic syndrome (MDS), diabetic retinopathy, neovascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ischaemia, infection, metabolic disease, nutritional deficiency, malignancy, or toxic agents, to promote the survival or growth of neurons. They can be used to treat motoneuron disorders such as amyotrophic lateral sclerosis (Lou Gehrig's disease), Bell's palsy, and various conditions involving spinal muscular atrophy, or paralysis. AL-2 can be used to treat human neurodegenerative disorders, such as Alzheimer's disease, Parkinson's disease, epilepsy, demyelinating diseases such as multiple sclerosis, Huntingtons chorea, Down's syndrome nerve deafness, Menier's disease, and other disorders of the cerebellum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI; 1997-535837/49

This protein sequence comprises a novel human cytokine designated Lerk-8. The amino acid sequence was deduced from a human foetal brain cDNA clone (see AAT89519). Lerk-8 binds to the cell surface receptors hek and elk, which are members of the eph/elk family of receptor tyrosine kinases. Lerk-8 polypeptides, especially soluble polypeptides comprising amino acid residues -27 to 142-197 of the cfull-length protein, can be expressed in transformed host cells. These polypeptides can be used to purify hek or elk proteins, and to purify or identify cells that express hek or elk proteins, and to purify or identify cells that express hek or elk on the surface. Such cells can be used in various in vitro studies or in vivo procedures, e.g. neural cells expressing elk can be administered to a mammal afflicted with a neurodegenerative disorder. The Lerk-8 polypeptides can also be used to deliver diagnostic or therapeutic agents to these cells (e.g. leukaemia cells). The Lerk-8 DNA and polypeptides can also be used to: treat disorders mediated by such as injury to neural tissue or neurologic disease; to promote can and for wound healing or stimulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Lerk-8; cytokine; human; hek; elk; receptor tyrosine kinase;
ligand; neurodegenerative disease; wound healing;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated cytokine, Lerk-8 - binds to the hek and elk receptor tyrosine kinases, used to develop products for diagnosis and therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 1997-503043/46.

It is encoded by a cDNA clone (AAT60966) obtd. from a human foetal brain cDNA library. The novel receptor ligand can be expressed in transformed host cells and used in methods for regulating the development, maintenance or regeneration of different cells (e.g. neurons) and tissues in vivo and in vitro. Soluble NLERK2 peptides can be used to treat injury, disease or abnormality in the nervous system, and membrane-bound NLERK2 to modulate proliferation, different or survival e.g. in grafting procedures or transplantation. NLERK2 can also be used to raise antibodies for use in immunotherapy, and to detect anti-NLERK2 antibodies that may occur in some autoimmune diseases.

Its amino acid sequence was deduced from a human frontal cortex cDNA clone (AAT69808). Recombinant Elf-6, truncated soluble polypeptides comprising the extracellular domain of Elf-6, and Ef1-6 ligandbodies comprising soluble Ef1-6 and the Fc portion of IgG can be expressed in host cells. These can be used to support neuronal and other Eph receptor-bearing cell populations for treatment of neurological disorders, in drug screening and to raise diagnostic
                                                                                                                                                                                                                                                                                                                                                                                 Sequence

CC tyrosine kinase receptor ligand. AL-2 can be administered to patients in CC whom the nervous system has been damaged by trauma, surgery, stroke, CC ischaemia, infection, metabolic disease, nutritional deficiency, CC malignancy, or toxic agents, to promote the survival or growth of CC amyotrophic lateral sclerosis (Lou Gehrig's disease), Bell's palsy, and CC amyotrophic lateral sclerosis (Lou Gehrig's disease), Bell's palsy, and CC amyotrophic lateral sclerosis, thou scular atrophy, or paralysis. AL-2 CC can be used to treat human neurodegenerative disorders such as CC Alzheimer's disease, Parkinson's disease, apilepsy, demyelinating CC diseases such as multiple sclerosis, Huntingtons chorea, Down's syndrome, CC AL-2 can be used as cognitive enhancer, to enhance learning particularly in dementias or trauma, since they can promote axonal outgrowth and CC synaptic plasticity, particularly of hippocampal neurons that express CAL-2. AL-2 can also be used for wound healing, i.e. accelerating CC neovascularisation of, e.g. burns and ulcers. The encoding nucleic acids and treating various neuronal disorders. AL-2 antagonists are useful in diagnosing cortein. The antibodies and the AL-2 antagonists are useful in diagnosing cortein. The antibodies and the AL-2 antagonists are useful in diagnosing and treating various neuronal disorders. AL-2 antagonists can be used for modulating angiogenesis. They can also be used for the treatment of cumours, acute myeloid leukaemia (AML), chronic myeloid leukaemia (CML), chronic myeloid leukaemia (CML), chronic myeloid leukaemia and rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human AL-2 neurotrophic factor and related DNA - used to develop products for, e.g. treating neurologic disorders, angiogenesis disorders, tumours or rheumatoid arthritis or for wound healing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AL-21; AL-2; AL-2-long; human; treatment; neurological disorder; tumour; rheumatoid arthritis; wound healing; paralysis; angiogenesis; leukaemia; psoriasis; Alzheimer's disease; epilepsy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This is a AL-2-long (AL-21) protein. The AL-2 is tyrosine kinase receptor ligand. AL-2 can be admit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 N-PSDB; AAV06354.

It is important in cellular communication during pattern formation. Its amino acid sequence was deduced from a cDNA clone (AAT40230) isolated from a newborn mouse brain cDNA library. The ELF-2 ligand can be used to alter neurological development, oncogenesis and growth regulation, to modulate binding of ELF-2 to the Eph receptor, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Eph receptor ligand, ELF-2, and DNA encoding it - used to prevent neurological diseases, and to modulate binding of Eph receptor, e.g. to prevent or treat tumour formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bergemann AD,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               23-FEB-1996;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    06-SEP-1996
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WO9626958-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Domain

specific typing (partic. as a marker for breast cancer) and as a
marker for human chromosome 13. The ligands (partic. in soluble
form) are used to activate the tyrosine kinase domain of the
Htk receptor, i.e. to stimulate or inhibit growth, differentiation,
and/or activation of cells conty. the receptor, e.g. treatment
of neurodegenerative diseases, since they are strongly expressed
in the cerebral cortex, hippocampus, striatum and cerebellum.
The ligands are also useful as a control or standard in assays,
for generation of antibodies, as a mol. wt. marker, for growth
in vitro of Htk-receptor positive cells, as research agent,
in screening, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mouse (AAT16470) and human (AAT16471) Htk ligand which activate, the Htk receptor, have been identified in a v tissues using a soluble Htk-Fc fusion protein. The predicted mol.wt. of the murine Htk ligand protein signal peptide cleavage is 34 kD with an estimated pI of the murine and human ligands show 96% homology at the a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ligand for the hepatoma trans-membrane kinase receptor - stimulating and inhibiting cells carrying the receptor, e

The present sequence is the human cytokine elk-ligand (elk-L), which binds a member of the tyrosine kinase receptor family. Elk-L exhibits neurotrophic and neuroprotective properties, and has a calculated mol. wt. 35180 daltons and a pI of 9.006. The elk-L cDNA, isolated from a human placental cDNA library, can be radiolabelled and used as a probe for isolating other mammalian elk-L cDNA. Elk-L can be used to treat neural tissue disorders,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This is the amino acid sequence of the human elk-L protein, a new cytokine that is the ligand for the elk tyrosine kinase receptor. The extracellular domain of the protein (amino acids 1-213) is used to generate a fusion protein comprising the Pc polypeptide of the human immunoglobulin G1 (extending from the hinge region to the C-terminus). The fusion protein (which has the same activities as the natural elk-L protein) has neuroprotective and neurotrophic activity so is potential useful for treating a wide range of neurological diseases.

                                                                                                                                                                                                                                                                The present sequence is a human elk ligand (elk-I) protein, which binds elk, has a calculated molecular weight of 35180 and an isoelectric point of 9.006. Elk-I is a cytokine that can be used to test cells for elk expression, measure the biological activity of elk, purify elk by affinity chromatography and as a neuroprotective agent to treat diabetic, hereditary and nutritional neuropathies and neurodegenerative diseases. It may also be added to tissue cultures to prolong the life of neurons. The elk-L cDNA was isolated from a human placental cDNA library, and is present as a cDNA insert in the recombinant vector deposited in strain
                                                                                                                                                                                                                                                                                                                                                                                                                                       Human elk ligand protein - as neuro-protective agent

                                               The present sequence represents human elk-L (elk ligand). The present invention describes antibodies to elk-L polypeptides. The elk-L protein is known to be neuroprotective exhibiting its effect through a trophic mechanism. Examples of diseases that may be treated with elk-L include neuropathles e.g. diabetic, hereditary and nutritional neuropathies, neurodegenerative diseases and other diseases characterised by loss of function or degeneration of neurons.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ef1-3 (also known as EHK-L) is an Eph transmembrane tyrosine kinase family ligand. It has homology with B61 (Ef1-1) and Ef1-2. Ef1-3 appears to comprise a conventional transmembrane protein with a cytoplasmic domain. Ef1-3 is useful for identifying other ligands for Ehk-1, -2, -3, Eck and Elk receptors. The ligands are useful in promoting a differential function and/or influencing the phenotye, such as growth and/or proliferation, of receptor bearing cells. They may be used in the diagnosis, and treatment of neurological disorders.

It is strongly expressed in the anterior hindbrain and newly-forming semites of embryos at the early organogenesis stage of development. Its amino acid sequence was deduced from a cDNA clone (AAT40231) isolated from a chicken cDNA library. The ELF-2 ligands can be used to alter neurological development, oncogenesis and growth regulation, to modulate binding of ELF-2 to the Eph receptor, and in diagnostic
                                                                                                                                                                                                                                                   Full length

The mature protein contained within this sequence contains the N-terminal fragment represented by AAW06332. The proteins of the invention have a molecular weight of 23500 (plus or minus 1500) Da, and are positive for Coomassie staining and PAS staining. The proteins of the invention bind to the fragment of this protein sequence represented by AAW06330. The proteins of the invention are new ligands of receptor-type tyrosine kinases, and can be prepared by standard

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A ligand polypeptide which binds to the extracellular part of a specific receptor-type tyrosine kinase and induces phosphorylation of tyrosine within the cell can be used in the study of the differentiation of blood cells such as the haematopoietic stem cells; of disease processes such as leukaemia, and of the biology of bone marrow transplantation. The ligand plays a role in the differentiation process and the specific ligand target is expressed differentiation process and the specific ligand target is expressed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ligand peptide binding intracellular tyrosine undifferentiated blood
 Hepatoma transmembrane kinase;

specific typing (partic. as a marker for breast cancer) and as a
marker for human chromosome 13. The ligands (partic. in soluble
form) are used to activate the tyrosine kinase domain of the
Htk receptor, i.e. to stimulate or inhibit growth, differentiation,
and/or activation of cells contg. the receptor, e.g. treatment
of neurodegenerative diseases, since they are strongly expressed
in the cerebral cortex, hippocampus, striatum and cerebellum.
The ligands are also useful as a control or standard in assays,
for generation of antibodies, as a mol. wt. marker, for growth
in vitro of Htk-receptor positive cells, as research agent,
in screening, etc.

                                                                                                                                                                                                                                                                                                                                                                                               The sequence represents a full-length LERX-5 cytokine, which binds elk and hek receptor protein-tyrosine-kinases (members of the eph/elk family), and expressed from a gene isolated by amplification with primers specific for a chromosome-13 expressed sequence tag, GenBank L13189, from a human T-lymphocyte leukaemia CCRF-HSB-2 (ATCC CCL 120.1) cell line, followed by cDNA probe screening of a human fetal brain cDNA library in phage lambda-gtl0. A truncated soluble form may also be produced. The protein may be produced as a recombinant fusion protein or dimer with an antibody Fc fragment or e.g. a FLAG affinity tail (R89288). LERK-5 may be used in binding assays to detect elk- or hek-expressing cells, to measure elk or hek activity, as a drug delivery for elk or hek receptor-specific cell therefore, e.g. for delivery of cytostatic agents in leukaemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DNA encoding LERK-5 cytokine capable of binding elk and hek - used as carrier to deliver attached (anti-leukaemic) agents to cells bearing elk or hek, i.e. human leukaemia cell lines JM and LK63

These sequences are included in the LPM medium of the invention. The medium is used to culture cells capable of producing a ligand for receptor-type tyrosine kinase. The ligand serves as a physiologically active substance to induce enzyme activity and autophosphorylation of tyrosine kinase, which is involved in the development and differentiation of animal and insect cells. The ligand can also be used as in a pharmaceutical preparation for promoting growth of undifferentiated cells. The medium may also include an inducer, such as insulin, an interleukin, a fibroblast growth factor, or interferon-gamma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAW06333 and AAW06334 represent receptor-type tyrosine kinase receptor binding ligands of the invention. These sequences both have the N-terminal sequence represented by AAW06332. The ligands of the invention recognise the fragment of the receptor type kinase receptor represented by AAW06330 (see AAW06331 for full length sequence). The proteins of the invention have a molecular weight of 23500 (plus or minus 1500) Da, and are positive for Coomassie staining and PAS staining. The protein is a new ligand of receptor-type tyrosine kinases, and can be prepared by standard recombinant techniques.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A ligand polypeptide which binds to the extracellular part of a specific receptor-type tyrosine kinase and induces phosphorylation of tyrosine within the cell can be used in the study of the differentiation of blood cells such as the haematopoietic stem cells; of disease processes such as leukaemia, and of the biology of bone marrow transplantation. The ligand plays a role in the differentiation process and the specific ligand target is expressed in undifferentiated blood cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            22-DEC-1994;

The patent discloses a complex comprising of a B class ephrin and PDZ domain containing protein. B class ephrins function as ligands for Eph receptor tyrosine kinases (RTK) and possess a transmembrane element and a highly conserved cytoplasmic tail at the C-terminus, that contains a PDZ binding site. This complex is used in methods to modulate the interaction of a B class ephrin and PDZ domain containing protein and to identify modulator compounds. It is also used for modulating cellular processes like, axonogenesis, nerve cell interactions and regeneration of nerve cells. The complex is also useful for treating proliferative or differentiative disorders associated with this protein complex. The present sequence is the human ephrin B C-terminal cytoplasmic domain, comprising conserved sequences reminiscent of known or predicted binding sites for PDZ domains. Ephrin B3 is also known as NIERK-2, EIK-13, EFL-6, ELF-3 and LERK-8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PDZ domain; B class ephrin; Eph receptor tyrosine kinase; RTK; modulator; cellular process; nerve cell interaction; regeneration of nerve cell; axonogenesis; antiproliferative, proliferative disorder; treatment; differentiative disorder; human; cytoplasmic domain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    멍
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ş
production of homogenous forms of clustered ligands is broadly applicable to improve the affinity and/or increase the activity of a ligand as compared to the native form of the ligand. Ephrin fusion proteins have been constructed, which may be useful for treating neurological disorders. The ephrin fusion proteins are preferably capable of binding to Elk receptor and are especially Ef1-6 antagonists. The fusion proteins were constructed after it was demonstrated that similar improved activities could be achieved using Tie-2 receptor ligands. Angiopoletin-1 (Ang-1) is a Tie-2 receptor ligand and is an agonist for Tie-2, whereas angiopoletin-2 (Ang-2) is a naturally occuring antagonist of the Tie-2 receptor. The fibrinogen domains (FD) of Ang-1 and Ang-2 are the receptor-binding domains and dimerized versions, of e.g. Ang-1-FD-Fc
                                                                                                                                                                                                                                                                                                                                                                                                         Polynucleotide encoding a fusion polypeptide, useful for promoting differential function and influencing phenotype, comprises two subunits containing at least one copy of the receptor binding domain of a ligand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              N-PSDB; AAA51346.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Davis

However, Ang-1-FD-FC is not able to induce phosphorylation (activate) the Tie-2 receptor on endothelial cells unless it is further clustered with goat anti-human Pc antibodies. The novel fusion proteins, mutant versions of Ang-1-FD and Ang-2-FD, were designed that were intrinsically more highly clustered. Tie-2 agonist fusion proteins may be used as haematopoietic factors. Tie-2 receptor antagonist fusion proteins may be used disorders of blood forming organs, e.g. thrombocythemias, polycythemias

                                                                                                                                                                                                                                                                                                                      CC production of homogenous forms of clustered ligands is broadly applicable CC to improve the affinity and/or increase the activity of a ligand as CC compared to the native form of the ligand. Ephrin fusion proteins have been constructed, which may be useful for treating neurological CC disorders. The ephrin fusion proteins are preferably capable of binding CC to Elk receptor and are especially Ef1-6 antagonists. The fusion proteins are proteins are preferably capable of binding CC to Elk receptor and are especially Ef1-6 antagonists. The fusion proteins CC Angiopoietin-1 (Ang-1) is a Tie-2 receptor ligands. Angiopoietin-1 (Ang-1) is a Tie-2 receptor ligand and is an agonist for CC fie-2, whereas angiopoietin-2 (Ang-2) is a naturally occuring antagonist CC of the Tie-2 receptor. The fibringen domains and dimerized versions, of e.g. Ang-1-FD-FC (Ang-1 fibringen domain fused to an FC domain), can bind to the Tie-2 receptor with much higher affinity than monomeric Ang-1-FD (dimerization cocurs between the FC components of adjacent molecules). However, CC Ang-1-FD-FC is not able to induce phosphorylation (activate) the Tie-2 receptor on endothelial cells unless it is further clustered with goat anti-human FC antibodies. The novel fusion proteins, mutant versions of CC Ang-1-FD and Ang-2-FD, were designed that were intrinsically more highly CC clustered. Tie-2 agonist fusion proteins may be used to CC diagnose or treat, e.g. myeloproliferative or other proliferative and listered for and lenkemias.

Extracellular region of an Eph B receptor is capable of binding with high affinity to a mammalian ephrin B ligand. Ephrin B ligand is capable of binding with high affinity to a mammalian Eph B receptor. The nucleic acid encoding the polypeptides or the polypeptides are useful for producing pharmaceutical compositions for treating a tumour disease or ocular necvascularisation in mammals, including humans. The vector is useful in producing a pharmaceutical composition for treating the diseases cited above in mammals, particularly humans, by means of gene therapy. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New soluble polypeptides of the extracellular region of the Eph B receptor and ephrin B ligands, useful in gene therapy for treating a tumor disease or ocular neovascularization in mammals, including humans

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to new isolated soluble polypeptides comprising an amino acid sequence of an extracellular region of an Eph B receptor or an amino acid sequence of an ephrin B ligand, or essentially similar amino acid sequences of extracellular region of an Eph B receptor or an amino acid sequences of extracellular region of an Eph B receptor is capable of binding with high affinity to a mammalian Ephrin B ligand is capable of binding with high affinity to a mammalian Ephrin B ligand is capable of binding with high affinity to a mammalian Ephrin B neceptor. The nucleic acid encoding the polypeptides or the polypeptides are useful for producing pharmaceutical compositions for treating a tumour disease or ocular neovascularisation in mammals, including humans. The vector is useful in producing a pharmaceutical composition for treating the diseases cited above in mammals, particularly humans, by means of gene therapy. The present sequence is human ephrin B2 ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New soluble polypeptides of the extracellular region of the Eph B receptor and ephrin B ligands, useful in gene therapy for treating a tumor disease or ocular neovascularization in mammals, including humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SAON)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   04-APR-2002

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAW06333 and AAW06334 represent receptor-type tyrosine kinase receptor binding ligands of the invention. These sequences both have the N-terminal sequence represented by AAW06332. The ligands of the invention recognise the fragment of the receptor type kinase receptor represented by AAW06330 (see AAW06331 for full length sequence). The proteins of the invention have a molecular weight of 23500 (plus or minus 1500) Da, and are positive for Coomassie staining and PAS staining. The protein is a new ligand of receptor-type tyrosine kinases, and can be prepared by standard recombinant techniques.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          09-NOV-1994;

These sequences can be included in the LPM medium of the invention. The medium is used to culture cells capable of producing a ligand for receptor-type tyrosine kinase. The ligand serves as a physiologically active substance to induce enzyme activity and autophosphorylation of tyrosine kinase, which is involved in the development and differentiation of animal and insect cells. The ligand can also be used as in a pharmaceutical preparation for promoting growth of undifferentiated cells. The medium may also include an inducer, such as insulin, an interval the medium may also include an inducer, such as insulin, an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to single exon nucleic acid probes (SENP: see ARI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
Human; single exon probe; asthma; lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human genome-derived single exon nucleic acid analyzing gene expression in human placenta -

                         The present invention relates to single exon nucleic acid probes see AAI31315-AAI57546). The present sequence is a peptide encode such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples from human placenta. The probes are useful for antenatal diagnos human capacita.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S
The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 1814 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung; comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung; measuring the label detectably bound to each probe of the array; identifying exons in a eukaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detectably specific hybridisation of detectably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             04-FEB-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, CC having a fragment identical to the predicted exon, the probe is included CC in the above mentioned microarray; assigning exons to a single gene, CC comprising (a) identifying exons from genomic sequence by the method CC above and (b) measuring the expression of each of the exons in several CC tissues and/or cell types using hybridisation to a single exon CC microarrays having a probe with the exon, where a common pattern of CC expression of the exons in the tissues and/or cell types indicates that CC the exons should be assigned to a single eyen; a peptide comprising one CC of 12011 sequences, mentioned in the specification, or encoded by the CC probes/open reading frames (ORF). The probes are used for gene CC expression analysis, and for identifying exons in a gene, particularly CC using human lung derived mRNA and for the study of lung diseases (CCODD), interstitial lung disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis, tuberous sclerosis, Gaucher's disease (CCODD), interstitial lung disease (ILD), familial idiopathic pulmonary CC haemosiderosis, pulmonary histocytosis, lymphangioleiomyomtosis, pulmonary haemosiderosis, pulmonary hybertension CC microaled by a single exon probe of the invention.

CC Note: The sequence data for this patent did not form particularion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

B class ephrins function as ligands for Eph creceptor tyrosine kinases (RTK) and possess a transmembrane element and a fightly conserved cytoplasmic tail at the C-terminus, that contains a PDZ conding site. This complex is used in methods to modulate the interaction of a B class ephrin and PDZ domain containing protein and to identify condulator compounds. It is also used for modulating cellular processes like, axonogenesis, nerve cell interactions and regeneration of nerve cells. The complex is also useful for treating proliferative or differentiative disorders associated with this protein complex. CC domain, comprising conserved sequences reminiscent of known or predicted binding sites for PDZ domains. Ephrin B2 is also known as Htk-L, ELF-2, CC LERK-5 and NLERK-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

consists and antigen pancreatic disorders, especially cancer condition parcellar and antipolic and susceptive, and can be used to detect, treat or prevent pancreatic disorders, especially cancer at the activities and can be used for conditions or a susceptibility to one in a subject. Binding partners to the proteins and the activity of the condition or a susceptibility to one in a subject. Binding partners to the proteins and the activity of the condition or a susceptibility to one in a subject. The pancreatic cancer antigens can be used to detect, treat or prevent pancreatic disorders, especially cancer. Agonists and antagonists to the antigens can be used for. The concertic cancer antigens can be used to design nucleic canceric cancer antigen polynucleotides can be used to design nucleic candalysis, tissue identification and/or typing and a variety of forensic cand diagnostic methods. The proteins can be used to generate antibodies which are used to purify, detect and target the polypeptides, including both in vivo and in vitro diagnostic and therapeutic methods. The proteins can be used to generate antibodies contains can be used to generate antibodies can be used to generate antibodies. The proteins can be used to generate antibodies can be used to treat to treat or prevent neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal or proliferative disorders.
